CYBER SAFETY GUY

iOS 27 JUST CHANGED THE RULES FOR PARENTS

5 NEW CONTROLS WORTH CHECKING NOW

Apple's redesigned parental controls give families more control over websites, contacts, apps and screen time.

1 ASK TO BROWSE

New websites can require your approval before your child can access them in Safari and supported browsers. Requests can arrive in Messages. It's on by default for children under 13.

TEENS TOO:
You can choose Approved Websites Only.

2 CONTACT APPROVAL

Parents can require permission before a child connects with a new contact through supported Phone, Messages and FaceTime communication. A new message can stay hidden until approved.

CHECK:
Allowed Contacts + Manage Contacts.

3 EXPANDED COMMUNICATION SAFETY

It now detects and intervenes before children see detected nudity, gore or violent content in shared images and videos, including FaceTime. Processing happens on the child's device.

PRIVACY:
Apple says the content and detection result stay on-device.

4 TIME ALLOWANCES + SCHEDULES

Set daily time budgets across categories such as Entertainment, Games and Social Media. Schedules can control which apps are available at different times and on weekdays or weekends.

QUICK ACTIONS:
Pause device use, allow unlimited use or change the schedule.

5 A FOCUSED START

When setting up a child account, parents can choose exactly which apps are available from the start: a few essentials, a recommended set or a custom selection. More apps can be added over time.

IDEA:
Start small, then add access as your child is ready.

BEFORE YOU START

Update every device in your Family Sharing group to iOS 27, iPadOS 27, macOS 27, watchOS 27 and/or visionOS 27, then update your family's parental controls.

Settings → Family → Your child's name

Some features vary by age, country/region and device.
